

1. Consider Iris dataset and implement Decision tree. Calculate Accuracy and error rate.

You can load the iris dataset using the code below -

```
from sklearn import datasets  
iris = datasets.load_iris()
```

2. Implement logistic regression and predict whether a tumor is malignant or benign in breast cancer dataset available on scikitlearn. Calculate Accuracy, precision, and recall and also print confusion matrix.

You can load the breast cancer dataset dataset using the code below -

```
from sklearn import datasets  
breast_cancer = datasets.load_breast_cancer()
```

$$Recall = \frac{True\ Positives}{True\ Positives + False\ Negatives} \quad (1)$$

$$Precision = \frac{True\ Positives}{True\ Positives + False\ Positives} \quad (2)$$
